Wastewater Capacity Charge: Unclear Whether Growth Is Paying for Growth

Peter Heineccius

Government Accountability & Oversight Committee August 23, 2016

## Why is WTD performing this study?

- Current capacity charge methodology "expires" in 2030
- Clean Water Plan being completed that will help identify capital needs over the next 40 years
- Some imbalances in the approach due to the structure
- 2016 Auditor's report recommended a more transparent model

## Current Methodology Background

### **Current version of the charge started with the "Robinswood Agreement" Letter**

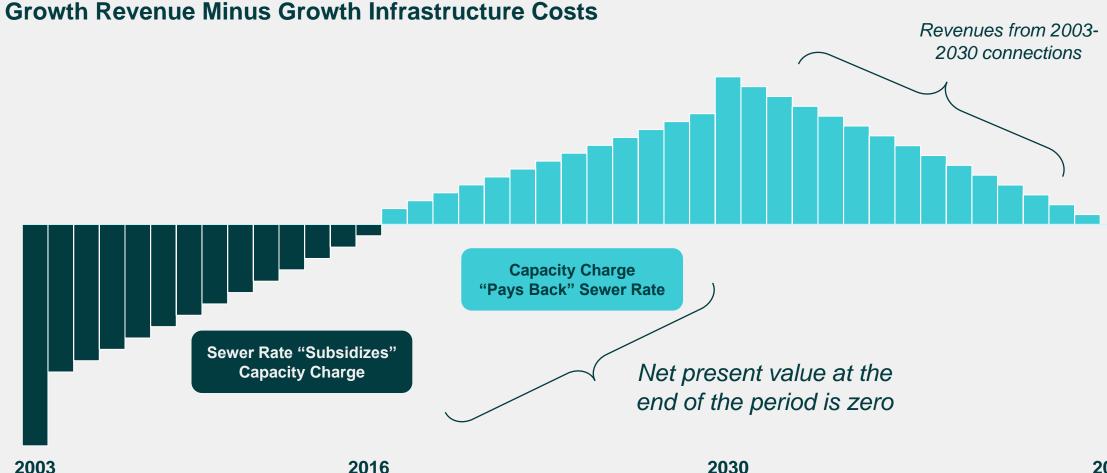

- Developed at the conclusion of the 1998 Regional Water Quality
  Committee retreat
- Established guiding principles related to the Regional Wastewater Services Plan to manage wastewater through 2030, including:

"The regional wastewater financing structure should reflect uniform regional rates for existing and new customers and achieve the <u>principle</u> of "growth pays for growth."

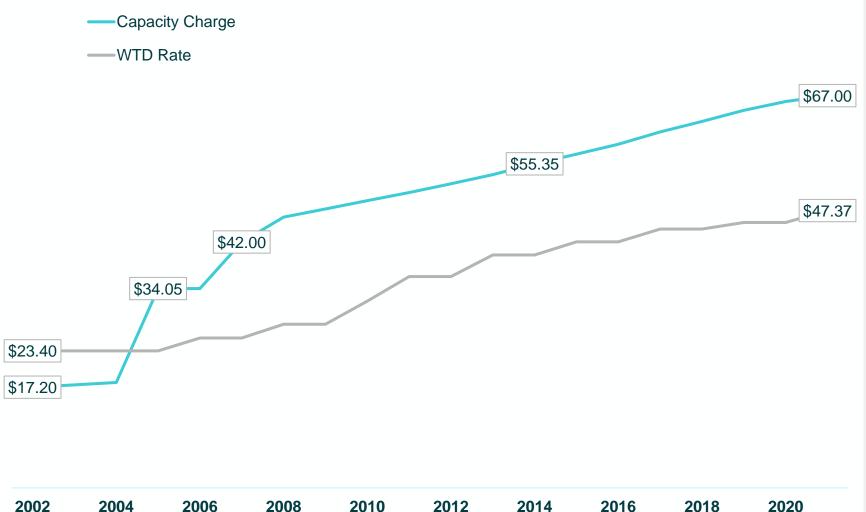

### Current capacity charge methodology was developed in 2001

- A separate charge assessed on development that results in new connections to the sewer system
- Billed by and paid to King County in addition to the regular monthly sewer rate
- How it works:
  - 1. Growth-related costs are identified
  - 2. Monthly rate revenue from growth customers is calculated
  - 3. The capacity charge is set to cover any shortfall from rate revenues

# How the capacity charge model tries to achieve "growth pays for growth"

## The capacity charge has increased significantly since 2002

- 7.4% average annual increase
- Approx. 3.0% per year after Brightwater completed in 2007
- WTD Rate has increased 3.7% per year over the same period

## Original methodology lacks transparency in meeting objective of "growth pays for growth"

- We're now 20 years into a 30-year plan the system is different than it was in 2000
- The model calculations are "locked away" inside macros
- WTD engaged Raftelis to:
  - Review the existing methodology
  - Rebuild the existing model
  - Evaluate alternative methodologies

## Current Methodology Where we're at now

### **Raftelis: the current approach of balancing revenue over a 30-year period is atypical**

• Conceptually, provides for equitable share of system investment and operational costs

 Practically, difficult to keep track of existing v. growthrelated costs and subject to volatility based on past performance and market conditions (discount rate)

# Part of this study was to validate the current model

- Raftelis developed a model without macros to provide transparency to the calculations and process
  - Evaluates the system costs and revenues based on the same assumptions and constraints
  - Also allows for various inputs to be evaluated for their impact on the results more clearly (e.g., inflation, discount rate, growth estimates, etc.)
- Key findings from the rebuild: the calculation is very sensitive to the discount rate

Discount Rate	Resultant Capacity Charge - 2020
6.0%	\$67.25
5.0%	\$44.74
4.0%	\$28.02
3.0%	\$13.55

### The capacity charge calculation is minimally sensitive to changing assumptions/inputs, but very sensitive to a different discount rate

Cash Financing %	Resultant Capacity Charge - 2020
40%	\$67.25
30%	\$66.62

Parity Debt Coverage	Resultant Capacity Charge - 2020
1.25x	\$67.25
1.50x	\$65.59

Growth CIP	Resultant Capacity Charge - 2020
Original	\$67.25
10% Reduction	\$50.78

Discount Rate	Resultant Capacity Charge - 2020
6.0%	\$67.25
5.0%	\$44.74
4.0%	\$28.02
3.0%	\$13.55

# Why explore alternative capacity charge methodologies?

- Develop a more transparent calculation
- Based on the value of system assets (existing and future)
- Existing and future capacity will determine costs per RCE
- A more predictable charge that is less dependent on historical revenues

# Goals of alternative capacity charge methodology

- Aligned with RCW Requirements
  - Key concept in RCW 35.58.570 is "equitable share"
  - Industry standard methodologies are based on the Rational Nexus Test aligned with the "equitable share" concept
- Accounts for current system investments and capacity, and future expanded capacity investments
  - Based on the value of system assets (existing and future)
  - Existing and future capacity will determine costs per RCE
- More transparent & predictable calculation

## Alternative Methodologies Where we're headed

### **Typical Fee Calculation Methodologies**

- Buy-In Approach
  - Focuses on existing facilities with available capacity to serve new customers
  - > Analysis based on fixed asset records
- Incremental/Marginal Cost Approach
  - Focuses on additional facilities required to meet anticipated growth
  - > Analysis based on capital improvement plan
- Combined Approach

### Chapter VII.2

AWWA MANUAL

M1

### System Development Charges

A system development charge (SDC) is a one-time charge paid by a new water system customer for system capacity. It is also assessed to existing customers requiring increased system capacity. The receipts from this charge are used to finance the development of growth-related or capacity-related water facilities and are an important funding/financing source for these facilities.

Although a one-time charge, SDCs are not always paid up front. Some states require utilities to offer an option to pay the SDC in installments if the fee is over a certain amount. Utilities often offer such an option with the potential for financing terms that allow for installment payments spread over several months or years.

The development of the appropriate level of SDCs provides utilities and policymakers with a cost-based analysis of the value of existing and planned capacity that is available or will be developed to serve and accommodate new capacity demands. By understanding the costs of providing capacity, policymakers can make an informed decision concerning the equity of allocating system capacity costs between existing and new customers.

Utilities make investments in capacity-related facilities that will provide service to new development in advance of when the new development occurs. Typically, the capacityrelated facilities are constructed in fairly large increments, and the new customers that this capacity is intended to serve will typically connect to the system over many years. As a result of the size of the capacity expansion and the timing of when customers connect to the system, the timing of receipts generated from the SDCs is rarely synchronized with the construction of the capacity-related facility. Therefore, SDCs provide an equitable method for recovering the costs of system capacity additions from those who will use the increased capacity; although in most cases, some portion of the capacity-related costs must still be recovered from user rates and charges assessed to all customers due to the aforementioned timing issues.

In general, SDCs are based on the costs for major backbone infrastructure components that are necessary to provide service to all customers, including source-ofsupply facilities, raw water transmission, treatment facilities, pumping facilities, storage tanks, and major treated-water transmission mains (e.g., "general benefit" facilities; see

## **Buy-In Approach**

## System Buy-In Approach

- Existing assets have capacity to serve new customers
  - New customers "Buy-In" to existing capacity
  - Establishes a cost per RCE of capacity in existing system
- Investment in assets based on original costs plus carrying costs
   > Per RCW 35.58.570
- Exclude outstanding debt to prevent "double-charging"
- Exclusion of grant-funded assets

#### Sample Fee Calculation

Original Cost of Eligible Assets + Carrying Costs

#### Less:

- Grant Funded / Donated
- Outstanding Debt Principal
- = Net System Assets (\$)
- ÷ Existing System Capacity (RCE)
- = Capacity Charge (\$/RCE)

### **System Buy-in Approach**

	Treatment Plants	Conveyance	CSO/Regulatory
Adjusted Asset Investments	\$ 110	\$ 50	\$ 25
Less Outstanding Debt Principal	-10	-20	-10
Net Asset Investment	\$ 100	\$ 30	\$ 15
Total System Capacity (RCEs)	100	120	150
Capacity Charge per RCE	\$ 1.00	\$ 0.25	\$ 0.10
Total Capacity Charge (\$/RCE)			\$ 1.35

## **Incremental Approach**

## Incremental Cost Approach

- Assigns cost of future capacity expansion to new customers
- CIP projects evaluated for portion that supports growth
  - > Utilizing current adopted CIP
  - Project-specific allocations of upsizing share by project
  - Clean Water Plan will inform updates
- Based on future RCE's added to system

#### **Sample Fee Calculation**

**Total Capital Improvements Projects** 

Identify Growth Capacity Share of Projects

- = Incremental Capacity Cost (\$)
- ÷ Capacity Provided by New Assets (RCE)
- = Capacity Charge (\$/RCE)

## **Incremental Approach Summary**

 The RCEs added by future growth-related projects will be informed by Clean Water Plan strategies

	Treatment Plants	Conveyance	CSO/Regulatory
Growth-related Project Costs	\$ 200	\$ 50	\$ 15
Added RCE Capacity	50	40	50
Capacity Charge per RCE	\$ 4	\$ 1.25	\$ 0.30
Total Capacity Charge (\$/RCE)			\$ 5.55

 Methodology allows for straightforward evaluation of how Clean Water Plan strategies will affect capacity charges

## **Combined Approach**

## Combined Methodology

- System Buy-in + Incremental Cost
- Existing assets have capacity to serve new customers
- Recognizes additional growthrelated facilities in capital improvement plan

### **Combined Approach Calculation**

	Treatment	Conveyance	CSO/Regulatory	Total
<u>Costs</u>				
Buy-In (Assets)	\$ 100	\$ 30	\$ 15	
Incremental (CIP)	\$ 200	\$ 50	\$ 15	
Total	\$ 300	\$ 80	\$ 30	
Available Capacity (RCEs)				
Existing	100	120	150	
Added	50	40	50	
Total	150	160	200	
Cost/Capacity (\$/RCE)	\$ 2	<u>\$ 0.50</u>	\$ 0.15	\$ 2.65

### **Benefits of a Combined Approach**

- Achieves the principle of growth pays for growth by recovering an equitable share of:
  - > Existing system assets based on available capacity
  - > Future system investments to serve growth

 Transparent and predictable since it is based on assets and not cashflow

# Where do we go from here? Next Steps

### **Next Steps**

 Code change to extend incremental update period of existing charges until Council adoption of Clean Water Plan

• WTD will continue to explore Combined Approach

 WTD would like feedback from MWPAAC related to alternative methodologies

## Thank you!

### System Buy-in Adjustments

- Exclude Vashon Island and Carnation treatment facilities
- Exclude grant-funded assets
- Should recover the core/"backbone" system assets
  Exclude small equipment and vehicles
- Asset management adjustment add CIP replacement project costs; remove related retired asset cost
