March 2022

Georgetown Wet Weather Station Project Update

King County's Wastewater Treatment Division is building a new wet weather treatment station in Georgetown, at the corner of Fourth Avenue South and South Michigan Street. The project also includes the construction of an outfall structure (completed in March 2020) and an underground conveyance pipeline connecting the treatment station to the outfall, which was completed in May 2021.

Progress at the Treatment Station:

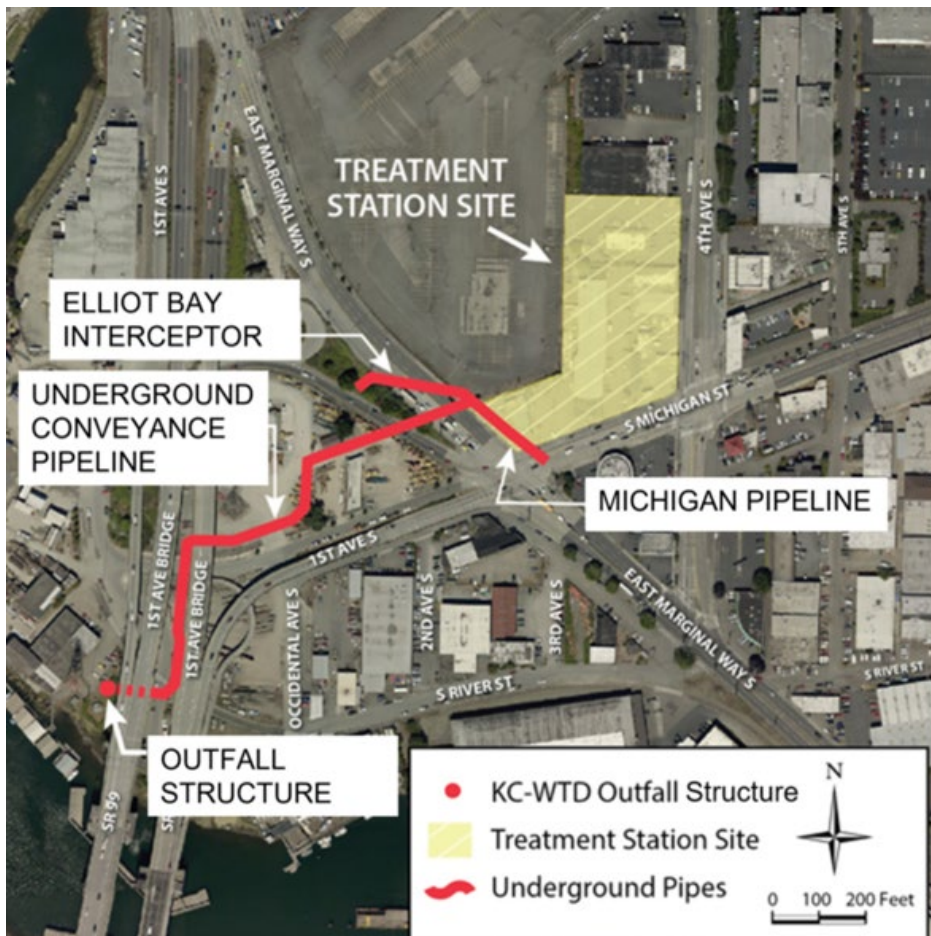

Construction of the treatment station continues. Much of the work is taking place inside the new station buildings. Outside, crews are continuing to build planting areas, permeable pavement areas, and other outdoor features. Community members may have seen some of the permanent fencing going up on the site.

In February crews installed the final fencing around parts of the treatment station site.

What to expect:

- Project team available by phone to brief and update community groups, business owners, and residents about construction activities and next steps for construction
- Noise and vibrations typical of construction
- Security fencing and erosion and sediment control around the project sites
- Project hotline from 8 a.m.– 5p.m; Monday - Friday: 206-205-9286

Did you know?

Once operational, it will take about 15 minutes for effluent (treated water) to travel from the treatment station to the outfall station (located under the First Avenue Bridge) and into the Duwamish River.
