

**Utility investigation work starts on October 28 continuing through November 8**

Starting as early as October 28, crews working for King County Wastewater Treatment Division will begin cutting into the existing pavement and digging holes using vacuum trucks to verify underground utility locations around the M Street Trunk Line in the City of Auburn. Crews anticipate completing the work by November 8, 2024. This work will provide important information about utility locations and will inform the design of the M Street Trunk Rehabilitation Project. Once utilities are verified, crews will restore the pavement surface.

The map below shows the location of the utility investigation work areas:

## What you can expect

- Work hours are 9 a.m. to 3 p.m. on business days between October 28 and November 8. Please note this work is weather dependent and schedules may shift.
- Traffic will be maintained in both directions of the work sites. However, expect lane closures.
- Driveway access will be maintained.
- Sidewalks and pedestrian walkways will be maintained, and flaggers will assist pedestrians as necessary.
- Temporary restriction of on-street parking in work areas
- Nearby neighbors may experience vibrations, noise, and dust from the sampling activities and drilling equipment. The noise generated by the trucks is below the allowable daytime noise limits within the City of Auburn.

Please watch for equipment and sign in the area, travel slowly and follow direction from flaggers in work zone area.

## About the project

The M Street Trunk Rehabilitation Project will repair about 2.6 miles of deteriorated sewer pipes with more than 100 side sewer connections to homes and businesses. The project will also rehabilitate 45 precast maintenance holes.

The rehabilitation work will keep the M Street trunk working for you and your neighborhood for decades, avoiding failure, overflow, and service disruption. During this work, all the wastewater carried through the M Street Trunk must be sent into a temporary system of pumps and bypass pipes above and below ground to maintain sewer service to the community.
