SITE DESCRIPTION

On March 7, 2023 Acre Environmental Consulting, LLC visited the approximate 0.23-acre site (no current address) located south of 12914 76th Avenue S, within the urban growth area of King County, Washington. The site is further located as a portion of Section 13, Township 23N, Range 4E, W.M. The parcel number for this property is 214480-0145. This parcel is currently zoned R6. The purpose of this site visit was to locate regulated critical areas on and adjacent to the subject site. Surrounding land use is comprised of single-family residences to the north and south, with forest located east of the site.

Access to this undeveloped site is from the west via 76th Avenue S which is located along the western border of the property. From 76th Avenue S, this property has an east and south aspect. The site was recently cleared to remove large quantities of Himalayan blackberry (*Rubus armeniacus*, Fac) and English ivy (*Hedera helix*, Upl). Vegetation on the site is currently represented by scattered red alder (*Alnus rubra*, Fac), English laurel (*Prunus laurocerasus*, Upl), and red elderberry (*Sambucus racemosa*, FacU). A small Category III wetland and an associated Type N stream are located on the southeastern portion of the site and extend off-site to the south. Wetland A received 5 points for Habitat Functions on the DOE Wetland Rating Form for Western Washington: 2014 Update. In King County, Category III wetlands with low habitat scores (3 to 5 points) adjacent to high impact land use (all sites within the Urban Growth Area), receive 80-foot standard buffers measured from the delineated edge. In King County, Type N waters within the urban growth area typically receive 65-foot protective buffers measured horizontally in a landward direction from the delineated ordinary high water mark (OHWM). When two or more buffers overlap, the more restrictive is applied. The majority of this site is encumbered with critical areas, buffer, and property setbacks.

PROJECT DESCRIPTION

The applicant is proposing to construct a single-family home in the northwestern portion of the property; as far from the on-site wetland and stream as is possible.

Because Wetland A scores low (5 points) for habitat, the applicant is proposing to reduce the 80-foot high impact buffer to that required for moderate intensity impacts (60 feet) by applying the applicable measure described in KCC21A.24.325(C)(6)(a)(b). Proposed measures to reduce development related impacts include directing lights away from wetland, locating the driveway away from the edge of the buffer, maintaining the existing hydrologic regime by directing roof runoff to the wetland and stream, and providing critical area signs and planting vegetation to demarcate the edge of the buffer and discourage intrusion.

Even after reducing the buffer to 60 feet as required for moderate intensity impacts, approximately 86 percent of the site is encumbered with wetland, stream, and associated buffer (this does not include required property setbacks). As a result of the extent to which this lot is encumbered by critical areas as buffers, the strict application of Chapter 21A.24 would deny all reasonable use of the subject property. Because the subject critical areas and buffer are located outside of the shoreline jurisdiction and because this project will require modification of a critical areas development standard (wetland and stream buffer) established by Chapter 21A.24, the applicant is proposing to permit this house using KCC 21A.24.070(B) (Reasonable Use Exception).

Placement of this house along with the associated 15-foot building setback will permanently impact a total of 3,940 square feet of the on-site buffer. The proposed house is commensurate with existing development in the area as the adjacent properties are developed with similarly sized single-family residences.

As mitigation for the proposed permanent buffer impacts, the applicant is offering to enhance the on-site portion of Wetland A (960 square feet) and 2,980 square feet of adjacent buffer. This will result in a total of 3,940 square feet of wetland and buffer enhancement which represents a wetland and buffer enhancement to permanent buffer impact ratio of 1:1 as required by KCC 21A.24.340(B)(1). Wetland and buffer enhancement will consist of removing invasive species (mostly already done) and planting native trees and shrubs. The proposed enhancement is expected to increase the level of functions and values provided by this wetland and buffer over that which currently exists and improve the function of and protection to the subject wetland and stream. Critical areas signs will be installed along the perimeter of the reduced buffer.

This project has been designed to avoid impacts to critical areas on the subject site to the greatest extent possible. As designed, the applicant is proposing a moderate size home located as far from the on-site wetland and stream as is possible. Impacts have been limited to those necessary to accommodate the house and the required building setback. As compensation for the permanent, unavoidable buffer impacts, the applicant is proposing to provide wetland and buffer enhancement on the subject site at a 1:1 ratio of buffer impact to wetland and buffer enhancement, as required by KCC 21A.24.340(B)(1). Following successful installation of the proposed plants, the mitigation areas will be monitored to ensure that they meet the stated performance standards. As a result, this project is in compliance with KCC 21A.24.125 (Avoiding Impacts to Critical Areas).

COMPLIANCE WITH KCC 21A.24.070(B) (REASONABLE USE)

Per KCC 21A.24.070(B), the director may approve alterations to critical areas, critical area buffers and critical area setbacks, except for flood hazard areas, if the application of this chapter would deny all reasonable use of the property as follow:

If the critical area, critical area buffer or critical area setback is outside of the shoreline jurisdiction, the applicant may apply for a reasonable use exception under this subsection without first having applied for an alteration exception under this section if the requested reasonable use exception includes relief from development standards for which an alteration exception cannot be granted under this section. The director shall determine that all of the following criteria are met:

Due to the extent and location of the on-site critical areas, if the required buffer were applied, no portion of this lot would be usable and all use of the site would be denied.

a) there is no other reasonable use with less adverse impact on the critical area;

Placement of one single-family residence on this 0.23-acre property is the minimum use that would result in a reasonable use of the subject site. There is no other use that strikes a better balance between allowing the applicant a use of their property and protecting the on-site critical areas.

b) development proposal does not pose an unreasonable threat to the public health, safety or welfare on or off the development proposal site and is consistent with the general purposes of this chapter and the public interest;

The construction of one single-family home on this site meets all other requirements of this chapter, and does not pose an unreasonable threat to the public health, safety or welfare on or off the development proposal site and is consistent with the general purposes of this chapter and the public interest. Construction of one house on this site is commensurate with the existing, allowed land use in the area. Furthermore, by constructing a house on this site in compliance with all applicable provisions of the King County Code, as well as enhancing a total of 3,940 square feet of the on-site wetland and buffer, the proposed project is expected to improve the functions of the on-site critical areas.

c) any authorized alteration to the critical area or critical area buffer is the minimum necessary to allow for reasonable use of the property; and

The applicant is proposing to build a single-family residence in the northwestern portion of the property as far from on-site critical areas as possible. Impacts have been limited to the house and the required 15-foot building setback. Stormwater from the proposed driveway will sheet flow and infiltrate to the adjacent native soils. Stormwater from the house will be collected in gutters and dispersed via splash blocks to the adjacent, native soils. These measures will ensure that the pre-development hydrologic regime is maintained. The placement of one single-family residence on the existing lot is in compliance with the underlying zoning and is the lowest density possible. Due to the constraints unique to this lot including the location of the on-site critical areas, there is no feasible on-site alternative that would allow a reasonable use with less adverse impacts to the on-site wetland buffer.

d) for dwelling units, no more than five thousand square feet or ten percent of the site, whichever is greater, may be disturbed by structures, building setbacks or other land alteration, including grading, utility installations and landscaping but not including the area used for a driveway or for an on-site sewage disposal system; and

Placement of the proposed house and associated 15-foot building setback will impact a total of 3,940 square feet of degraded buffer on the site. This is less than the allowed 5,000 square feet.

METHODOLOGIES OF CRITICAL AREAS DETERMINATION

On March 7, 2023 Acre Environmental Consulting, LLC conducted a site visit to locate wetlands and streams on and adjacent to the subject site. The methods used for delineating, classifying, and rating the critical areas in the project area are consistent with current Federal, State, and King County requirements. At the time of our March 7, 2023 site investigation, the weather was sunny with a temperature of 46 degrees Fahrenheit.

The site was assessed for the presence of wetlands using the routine methodologies described in the <u>U.S. Army Corps of Engineers Wetland Delineation Manual</u> produced in 1987 and the <u>U.S. Army Corps of Engineers Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region produced in May 2010 (hereinafter referred to as "the Corps Regional Supplement"). The Corps Regional Supplement is designed for concurrent use with the 1987 Corps Wetland Delineation Manual and all subsequent versions. The 2010 Regional Supplement provides technical guidance and procedures for identifying and delineating wetlands that may be subject to regulatory jurisdiction under Section 404 of the Clean</u>

Water Act. Where differences in the two documents occur, the Corps Regional Supplement takes precedence over the Corps Manual for applications in the Western Mountains, Valleys, and Coast Region.

According to the federal methodologies described above, identification of wetlands is based on a three-factor approach involving indicators of hydrophytic vegetation, hydric soils, and the presence or evidence of persistent hydrology. Except where noted in the manuals, the three-factor approach discussed above requires positive indicators of hydrophytic vegetation, hydric soils, and wetland hydrology, to make a determination that an area is a regulated wetland. Using the aforementioned manuals, the procedure for making a wetland determination include the following:

- 1.) Examination of the site for hydrophytic vegetation (species present/percent cover);
- 2.) Examination for the presence of hydric soils in areas where hydrophytic vegetation is present; and
- 3.) The final step is determining if wetland hydrology exists in the area examined under the first two steps.

Per industry standards, *Acre Environmental Consulting, LLC* examined the entire project site. Per current King County requirements, *Acre Environmental Consulting, LLC* also assessed adjacent properties within 300 feet of the proposed project limits, to the maximum extent possible without entering adjacent properties. While a detailed assessment of Critical Areas on adjacent properties was not possible due to the lack of legal access, *Acre Environmental Consulting, LLC* conducted a review of all available information to assess the presence of off-site Critical Areas within 300 feet of the subject site. This review is required by King County to determine if any regulated Critical Areas exist off-site which would cause associated protective buffers to extend onto the property and affect the development proposal.

In addition to on-site field reviews, *Acre Environmental Consulting*, *LLC* examined aerial photographs and topographical data (elevation contours) on King County's interactive mapping system (iMAP). Soil survey maps produced by the Natural Resources Conservation Service (NRCS), National Wetlands Inventory (NWI) maps produced by the U.S. Fish and Wildlife Service (USFWS), SalmonScape fish distribution maps produced by the Washington Department of Fish and Wildlife (WDFW), and StreamNet fish distribution maps produced by Pacific States Marine Fisheries Commission were also evaluated by *Acre Environmental Consulting*, *LLC* as part of this project consultation.

BOUNDARY DETERMINATION FINDINGS

Wetlands were classified according to the U.S. Fish and Wildlife Service (USFWS) Cowardin system <u>Classification of Wetlands and Deepwater Habitats of the United States</u> (Cowardin et al., 1979) and rated, by categories, according to the Washington State Department of Ecology <u>Wetland Rating Form for Western Washington: 2014 Update</u>, as required by the King County Code, Chapter 21A.24 (Critical Areas). Buffers are also determined by this chapter.

Wetland A

HGM Class: Slope

Cowardin: Palustrine, Scrub-shrub wetland, Broad-leaved Deciduous, Seasonally Flooded /

Saturated (PSS1E)

Ecology Rating: Category III

King County Rating: Category III, 80' Buffer

Wetland A is a small Category III wetland that is located on the southeastern portion of the site and extends off-site to the south. This wetland is associated with Stream A which flows south through a series of concrete drainage pipes along the eastern border of the site. This hydrogeomorphic (HGM) class slope wetland received a total score for functions of 16 points (6 points for Water Quality Functions, 5 points for Hydrologic Functions, and 5 points for Habitat Functions) on the DOE Wetland Rating Form for Western Washington: 2014 Update. Wetlands with scores between 16 and 19 points for all functions are classified as Category III wetlands per KCC 21A.24.318. In King County, Category III wetlands with low habitat scores (3 to 5 points) adjacent to high impact land use (all sites within the Urban Growth Area), receive 80-foot standard buffers measured from the delineated edge.

Vegetation in this wetland is currently comprised of creeping buttercup (*Ranunculus repens*, Fac). Based on conversations with the land owner and aerial photographs, it appears that prior to the recent clearing, vegetation in this wetland was dominated by Himalayan blackberry (*Rubus armeniacus*, Fac). Soils in this wetland have a Munsell color of very dark grayish brown (10YR 3/2) with redoximorphic features of dark yellowish brown (10YR 4/4), and and a texture of sandy loam from 0 to 18 inches below the surface. Soils in this wetland were saturated at 4-inches below the surface during our March 7, 2023 site investigation.

Stream A - Type N

Cowardin: Riverine, Intermittent, Streambed, Concrete (R4SB)

King County Rating: Type N stream, 65' Buffer

Stream A flows south along the eastern border of the subject site through an open channel comprised of half sections of 12-inch diameter concrete culvert, and drains off-site to the south. The concrete channel terminates near the southeastern corner of the subject site. From this point the channel continues south as a rock lined channel. This drainage feature is not depicted on any available mapping resource and does not support fish use. In King County, Type N waters within the urban growth area typically receive 65-foot protective buffers measured horizontally in a landward direction from the delineated ordinary high water mark (OHWM).

Non – Wetland

The site was recently cleared to remove large quantities of Himalayan blackberry (*Rubus armeniacus*, Fac) and English ivy (*Hedera helix*, Upl). Typical vegetation in the non-wetland portions of the site is currently represented by scattered red alder (*Alnus rubra*, Fac), English laurel (*Prunus laurocerasus*, Upl), and red elderberry (*Sambucus racemosa*, FacU). Typical soils in the non-wetland portions of the site have a Munsell color of dark brown (10YR 3/3), with a texture of gravelly sandy loam from 0 to 18 inches below the surface. Soils were moist during our March 7, 2023 site investigation.

NATURAL RESOURCE CONSERVATION SERVICE SOILS DESCRIPTION:

The Natural Resources Conservation Service (NRCS) mapped the subject property as being underlain by Alderwood-Everett-Urban land complex, 12 to 35 percent slopes.

BUILDING SETBACKS

Pursuant to King County Code (KCC) section 21A.24.200: "Unless otherwise provided, an applicant shall set buildings and other structures back a distance of fifteen feet from the edges of all critical area buffers or from the edges of all critical areas, if no buffers are required. When the site disturbance is within a critical area buffer, the building setback line shall be measured from the building footprint to the edge of the approved site disturbance. The following are allowed in the building setback area:

- A. Landscaping;
- B. Uncovered Decks;
- C. Building overhangs if the overhangs do not extend more than eighteen inches into the setback area;
- D. Impervious ground surfaces, such as driveways and patios, but the improvements are required to meet and special drainage provisions specified in public rules adopted for the various critical areas;
- E. Utility service connections as long as the excavation for installation avoids impacts to the buffer; and
- F. Minor encroachments if adequate protection of the buffer will be maintained."

EXISTING FUNCTIONS AND VALUES

The methodologies for this functions and values analysis are based on professional opinion developed through past field analyses and interpretations. This assessment pertains specifically to the subject wetland and associated buffer, but is typical for assessments of similar systems throughout western Washington. The three main functions provided by wetlands include water quality, stormwater / hydrologic control, and wildlife habitat. Buffers serve to protect and support the functions of wetlands and streams as well as provide their own wildlife habitat, water quality, and erosion control functions.

Wetland A and its associated buffer provide a low level of functions and values. This hydrogeomorphic class slope wetland has a limited ability to retain stormwater. Due to the sloped nature of this system, rather than being stored in this wetland, water is released relatively quickly to downstream systems. As a result, this wetland provides limited stormwater storage functions.

Wetlands in western Washington often contain important wildlife habitat resources such as food, water, thermal cover, and hiding cover in close proximity. The subject wetland and associated buffers provide protected habitat, which becomes increasingly important as areas become further populated with humans and habitat areas become fragmented. This wetland provides a

low level of habitat for wildlife species as evidenced by Habitat Function scores on the <u>Wetland Rating Form for Western Washington: 2014 Update</u> of 5. During our field investigation, Acre Environmental Consulting observed the following species of wildlife on the site: American robin (*Turdus migratorius*).

The vegetation within the vegetated portion of Wetland A and its associated buffer serves to intercept rain fall before it strikes the soil, thereby reducing erosion and improving water quality. The presence of adsorbent soils and the biological action of the wetland vegetation, serve to remove sediment and pollutants from the water. These materials are bound in the soil and plant material providing increased water quality to downstream systems.

The subject stream provides functions to the surrounding environment such as hydrological transport, transport of solids (suspended and dissolved), and important fish and wildlife habitat features, among other functions. The portions of the site adjacent to the stream (vegetated wetland and associated buffers, etc.) are increasingly important to manage appropriately as these areas aid in water quality and hydrologic control, resulting in cleaner water entering downstream systems.

WETLAND & BUFFER ENHANCEMENT

As mitigation for the 3,940 square feet of buffer impacts resultant from construction of the proposed house, the applicant is offering to enhance the on-site portion of Wetland A (960 square feet) and 2,980 square feet of adjacent buffer. The buffer enhancement will occur in two distinct areas, Enhancement Area A (1,554 square feet) and Enhancement Area B (1,426 square feet), located north and south of Wetland A. This will result in a total of 3,940 square feet of wetland and buffer enhancement which represents a wetland and buffer enhancement to permanent buffer impact ratio of 1:1 as required by KCC 21A.24.340(B)(1). Wetland and buffer enhancement will consist of removing invasive species (mostly already done) and planting native trees and shrubs. Plant quantities and spacing were determined using the King County Critical Areas Mitigation Guidelines. All proposed species are native to the Puget Sound region and have been selected for their benefits to wildlife and their proven success on past mitigation projects. Due to the low likelihood of survival, no herbs have been proposed in the wetland enhancement. The enhancement areas are proposed to be planted with the following native trees and shrubs.

Buffer Enhancement Area A (1,554 square feet)

Common Name	Latin Name	Size	Spacing	Quantity
Shore pine	Pinus contorta	2 gallon	9'	9
Western red cedar	Thuja plicata	2 gallon	9'	9
Osoberry	Oemleria cerasiformis	1 gallon	6'	9
Baldhip rose	Rosa gymnocarpa	1 gallon	6'	9
Snowberry	Symphoricarpos albus	1 gallon	6'	9
Oregon grape	Gaultheria shallon	1 gallon	6'	9
Sword fern	Polystichum munitum	1 gallon	6'	9

Buffer Enhancement Area B (1,426 square feet)

Common Name	Latin Name	Size	Spacing	Quantity
Shore pine	Pinus contorta	2 gallon	9'	9
Western red cedar	Thuja plicata	2 gallon	9'	9
Osoberry	Oemleria cerasiformis	1 gallon	6'	8
Baldhip rose	Rosa gymnocarpa	1 gallon	6'	8
Snowberry	Symphoricarpos albus	1 gallon	6'	8
Oregon grape	Gaultheria shallon	1 gallon	6'	8
Sword fern	Polystichum munitum	1 gallon	6'	8

Wetland Enhancement (960 square feet)

Common Name	Latin Name	Size	Spacing	Quantity
Western red cedar	Thuja plicata	2 gallon	9'	11
Nootka rose	Rosa nutkana	1 gallon	6'	6
Sitka willow	Salix sitchensis	1 gallon	6'	20

GRASS SEEDING

Any disturbed soil in environmentally critical areas or buffers shall be seeded to the recommended grass seed mixtures below, or similar approved mixtures.

Common Name	Latin Name	lbs/1,000 s.f.
Tall fescue	Festuca arundinacea	0.4
Colonial bentgrass	Agrostis tenuis	0.4
Annual ryegrass	Lolium multiflorum	0.5
Red clover	Trifolium repens	0.2

PROJECT NOTES

Pre-Construction Meeting

There will be a pre-construction meeting on this site between the applicant, the consulting biologist, landscaper(s) and a King County representative. The objective will be to verify the location of the mitigation areas and to discuss project sequencing.

Inspections

A qualified biologist shall be contracted to periodically inspect the mitigation measures described in this plan. Minor adjustments to the original designs may be necessary prior to and during construction due to unusual or hidden site conditions. A King County representative and/or the consulting biologist will make these decisions during construction.

Construction Timing and Sequencing

All mitigation planting shall take place in early spring or late fall.

PLANTING NOTES

Wetland and buffer mitigation projects are typically more complex to install than can be described in plans. Careful monitoring by a qualified biologist for all portions of this project is strongly recommended. Timing and sequencing is important to the success of this type of project.

Plant in the early spring or late fall. Order plants from a reputable nursery. Care and handling of plant materials is extremely important to the overall success of the project. All plant materials recommended in this plan should be available from local and regional sources, depending on seasonal demand. Some limited species substitution may be allowed, only with the agreement of the consulting wetland professional or King County DDES Environmental Scientist.

The plants shall be arranged with the appropriate numbers, sizes, species, and distribution to achieve the required vegetation coverage. The actual placement of individual plants shall mimic natural, asymmetric vegetation patterns found on similar undisturbed sites in the area.

Colored surveyors ribbon, or other approved marking device shall be placed next to each planted tree and shrub to assist in locating the plants while removing the competing non-native vegetation and to assist in monitoring the plantings.

Wood chips or other suitable material shall be used for mulching in the planting areas. Any existing vegetation is to be removed from a two-foot diameter area at each planting site. Mulch is to be placed in this two-foot diameter area at a depth of three to four inches. A four-inch diameter ring around the base of each plant shall be kept free of mulch.

Water should be provided during the dry season (July 1 through October 15) for the first two years after installation to insure plant survival and establishment. Water should be applied at a rate of 1 inch of water twice per week for year one and 1 inch per week during year two.

Inspections. A biological professional shall be present on site to inspect the plants prior to planting. Minor adjustments to the original design may be required prior to and during construction.

CONTINGENCY PLAN

Should any monitoring report reveal the mitigation has failed in whole or in part, and should that failure be beyond the scope of routine maintenance, the applicant must submit a Contingency Plan. This plan may range in complexity from a list of plants substituted, to cross-sections of proposed engineered structures. Once approved, it may be installed, and will replace the approved mitigation plan. If the failure is substantial, DDES will likely extend the monitoring period for that mitigation.

MAINTENANCE

The mitigation areas will require periodic maintenance to replace vegetation mortality as necessary. Maintenance shall be required in accordance with King County Critical Areas Mitigation Guidelines and approved plans. Maintenance may include, but not be limited to, removal of competing grasses, irrigation, fertilization (if necessary), replacement of plant mortality, and the replacement of mulch for each maintenance period. During Year One, every failed planting must be replaced. Other maintenance must be done twice every year for the length of the monitoring period. All work is to be performed by hand wherever possible, and with the lightest possible equipment where such use is imperative.

Duration and Extent: In order to achieve performance standards, the Permittee shall have the mitigation area maintained for the duration of the monitoring period (three years).

Standards for Replacement Plants: Replacement plants shall meet the same standards for size and type as those specified for the original installation unless otherwise directed by the Landscape Designer, Wetland Biologist, and/or King County DDES Environmental Scientist.

Herbicides / Pesticides: No herbicides or pesticides whatsoever shall be used in the mitigation/restoration area, sensitive areas, or their buffers.

Weeding: Trees and shrubs must be weeded to the dripline, and mulch maintained at 3" depth. Weed herbaceous plantings as necessary (flowers, ferns, etc.).

Removal: All litter, dumping, and non-native vegetation (e.g., Himalayan blackberry, reed canary grass, evergreen blackberry, Scotch broom, English ivy, morning glory, Japanese knotweed, etc.) must be removed and properly disposed of off-site.

Structures: Damaged or missing fences, posts, signs, habitat or hydrology structures must be repaired or replaced.

General: The Permittee shall include in general maintenance activities the replacement of any vandalized or damaged signs, habitat features, fences, or other structural components of this mitigation site.

REQUIRED FINANCIAL GUARANTEE

In an effort to determine the estimated cost of the installed mitigation project and future monitoring / maintenance costs associated with the project over a three-year period, the <u>King County Critical Areas Bond Quantity Worksheet</u> was completed. Please view the project-specific Bond Quantity Worksheet completed by *Acre Environmental Consulting, LLC* which is included with this mitigation plan.

PROJECT MONITORING

Requirements for monitoring project:

- 1. Initial compliance report within 30 days of installation.
- 2. Yearly site inspection (once per year in the fall) for three years.
- 3. Annual reports including final report (one report submitted by October 31st of each monitored year).

Purpose for Monitoring: The purpose for monitoring this mitigation project shall be to evaluate its success. Success will be determined if monitoring shows that at the end of three years, the success described in the <u>Project Success & Compliance</u> section of this plan are being met. The property owner shall grant access to the mitigation area for inspection and maintenance to the contracted landscape or wetland specialist and the King County biologist during the period of the bond or until the project is evaluated as successful.

Monitoring: Monitoring shall be conducted annually for three years in accordance with the approved mitigation plan. Up to 20 percent of any stratum can be comprised of desirable native volunteers when measuring cover. No more than 10 percent cover of non-native or other invasive species is permissible in any monitored year. Bond holders are encouraged to maintain mitigation sites within these standards throughout the monitoring period, to avoid corrective measures.

Vegetation Monitoring: Sampling points will be established for vegetation monitoring, and photo points established from which photos will be taken throughout the monitoring period. Vegetation sampling will consist of a visual assessment. Monitoring of vegetation shall occur in the fall of each monitored year (September to October).

Photo points: No less than four permanent photo points per project or per acre, whichever is greater will be established within the mitigation areas. Photographs will be taken from these points to visually record condition of the restoration area. Photos shall be taken during the fall monitoring visit.

Report Contents: Monitoring reports shall be submitted by October 31 of each year during the monitoring period. As applicable, monitoring reports must include descriptions / data for:

- a. Site plan and location map;
- b. Historic description of project, including date of installation, current year of monitoring, restatement of mitigation / restoration goals, and performance standards;
- Plant survival, vigor, and areal coverage for every plant community (transect data), and explanation of monitoring methodology in the context of assessing performance standards;
- d. Site hydrology, including extent of inundation, saturation, depth to groundwater, function of any hydrologic structures, inputs, outlets, etc.;
- e. Slope condition, site stability, any structures or special features;
- f. Buffer conditions, e.g., surrounding land use, use by humans, and/or wild and domestic creatures;
- g. Observed wildlife, including amphibian, avian, and others;
- h. Soils, including texture, Munsell color, rooting, and oxidized rhizospheres;
- i. Color photographs taken from permanent photo-points as shown on Monitoring Plan.

Mitigation Correction: Any deficiency discovered during any monitoring or inspection visit must be corrected within 60 days.

PROJECT SUCCESS AND COMPLIANCE

Criteria for Success: Upon completion of the proposed mitigation project, an inspection by a wetland professional will be made to determine plan compliance. A compliance report (as-built) will be supplied to King County within 30 days after the completion of planting. A qualified biologist will do condition monitoring of the plantings in the fall, annually and will make recommendations for maintenance to the mitigation areas following each visit. A written report describing the monitoring results will be submitted to King County after each site inspection for each monitored year. Final inspection will occur three years after completion of this project, or when the stated performance standards are met.

Goal: The goal of this mitigation project is to off-set buffer impacts from the proposed house by providing wetland and buffer enhancement which will provide wildlife habitat and increase protection to the wetland.

PERFORMANCE STANDARDS

Performance standards have been established to assess the success of the mitigation project in achieving the stated goals. Performance standards are as follows:

<u>Performance Standard 1</u>: There shall be 100 percent survival of all the plantings after Year 1 or the installation contractor shall replace the material. There shall be 80 percent survival of all the plantings after Year 3. The species mix should resemble that proposed in the planting plans, but strict adherence to obtaining all of the species shall not be a criterion for success.

<u>Performance Standard 2</u>: There shall be greater than 60 percent cover of woody species (shrub and tree cover) in the buffer after the third year post-installation. Naturally occurring, native plants shall be included in the calculation of vegetation coverage.

<u>Performance Standard 3</u>: There shall be no more than 10 percent cover of weedy/invasive species in the mitigation areas at any time throughout the monitoring period.

If the project meets all of the criteria for success at the end of the three-year monitoring period, no further action will be required and the financial guarantee will be returned to the applicant in full. If the definition of success is not met for any reason at the end of the monitoring period, the maintenance and monitoring period will be extended for one year at a time until the site meets the stated performance standards. If the definitions of success and the accompanying performance standards are met in less than three years, the monitoring may be terminated and the bond released at that point. This mitigation plan and the accompanying maintenance and

monitoring will not be considered fully complete until written confirmation is received from King County.

POST-PROJECT FUNCTIONS AND VALUES

Due to the existing low level of functions and values provided by the critical areas and buffer on the subject site and the proposed wetland and buffer enhancement, no significant adverse environmental impacts are expected to occur as a result of this project, assuming the compensatory mitigation is implemented as stated in this plan. Although impacts within the onsite buffer are necessary to accommodate the proposed development, no net loss of ecological functions is expected to occur. The buffer on this highly urbanized site that is proposed to be impacted has been historically disturbed and was recently cleared to remove invasive Himalayan blackberry. As a result, this area provides a relatively low level of functions and values, and little protection to the subject critical areas. The proposed wetland and buffer enhancement will increase vegetative species diversity and vegetative structure. This will increase wildlife habitat as well as water quality and stormwater storage functions, and is expected to generally increase the overall level of functions and values provided by the subject site.

TERMS & CONDITIONS

The environmental consulting work conducted, including this Critical Areas Study (collectively the "Services") is supplied to Rachael and Sean Rasor (the "Client") as a means of determining whether any wetlands, streams, and/or fish and wildlife habitats regulated by the King County Critical Areas Regulations exist on, or adjacent to the site. The Services are provided in accordance with the following General Terms and Conditions (the "Terms").

In accepting the Services provided by *Acre Environmental Consulting*, LLC ("Acre"), the Client voluntarily enters into and agrees to the binding effect of the following Terms. This report is intended to provide information deemed relevant in the Client's attempt to comply with the regulations currently in effect. The work for this report has conformed to the standard of care employed by professional ecologists in the Pacific Northwest. All other representations or warranties, whether express or implied, are hereby disclaimed concerning the work or this report. This report is based largely on readily observable conditions and, to a lesser extent, on readily ascertainable conditions. No attempt has been made to determine hidden or concealed conditions. If such conditions exist or arise, the information contained in this report may be rendered inaccurate or incomplete based upon those conditions. Acre acts solely as an independent contractor in providing the Services to the Client, and nothing in the provision of such Services shall be construed as creating an agency, partnership, joint venture or other similar legal relationship between Acre and the Client.

The laws applicable to Critical Areas are subject to varying interpretations. While Acre observed professional industry standards when completing this review, the information included in this report does not guarantee approval by any federal, state, and/or local permitting agencies. Therefore, all work on this property should not commence until permits have been obtained from all applicable agencies. If there are any questions regarding this report, please contact me at 206.450.7746.

Acre Environmental Consulting, LLC.

Riverine Wetlands

Mag of:	To arawer questions:	Figure #
Coward'n plant classes	1111,814	
Hydroperiods	H12	
Ponded depressions	R1.1	
Boundary of year within 150 ft of the wetland (con be added to enother figure)	R2.4	
Plant curer of trees, shrubs, and herbaceous plants	R12.842	
Width of unit vs. width of stream (can be added to another figure)	841	
Map of the contributing basin	R2.2, R2.3, R5.3	
I lan Polygon; Area that extends I lan from antine wetland edge - including polygons for accessible habites and underurbed hatiful	H21, H22, H23	
Screen capture of map of 303(d) liked waters in basin (from Ecology website)	R3.1	
Streen capture of list of TMDLs for WRIA in which unit a found (from web)	R3.2, R3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	PATRIEN
Cowardin plant classes	111, 141, H14, H14	1
Plant cover of treet, shrubs, and herbaceous plants	11.2	ĺ
Boundary of area within 150 ft of the weilland (can be upded to gnother figure)	12,2	
I km Polygon: Avea that extends I km from ontire wetland edge - including polygons for excessible habitat and unsbaturoed habitat	H21, H22, H23	
Screen capture of map of 303(d) listed weters in basin (from Ecology website)	134,132	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	13.3	

Slope Werlands

Map oft	To answer questions:	Figure
Cowardin plant classes	H13, H14	
Hydropesiods	H12	/
Plant cover of dense trees, shrubs, and herbaceous plants	513	-
Plant cover of dense, rigid treets, simple, and herbateous plants (one be odded to figure above)	1115	-
Boundary of 150 ft buffer (can be added to another figure)	\$21,55.1	-
I km Polygom: Area that extends I km from antire wetland edge - including polygons for accessible habitat and undisturbed habitat	H23, H22, H23	2
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	531,532	3
Screen capture of list of TMDLs for W89A in which unit is found (from web)	\$3.3	0

Wetland Rating System for Western WA: 2014 Update. Sating Form - Effective January 1, 2015

Wetland name or number A

HGM Classification of Wetlands In Western Washington

If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in For questions 1-7, the criteria described must apply to the entire unit being rated

Are the water levels in the entire unit usually controlled by tides except during floads?

questions 1-7 apply, and go to Question B.

YES - the wedand class is Tidal Fringe - go to 1.1

PALE the selffify of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

NO - Saltwater Tidal Fringe (Estuarine)

If your wetland can be classified as a Preshivator Tidal Fringe use the forms for Riverine wetlands. If it is Salbwater Tidal Fringe it is an Estuarine wetland and is not scored. This method cannot be used to score functions for estuarine wetlands YES - Freshwater Tidal Fringe

The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

Lyour wetland can be classified as a Flots wetland, use the form for Depressional wetlands

NO go to 3

YES - The wetland class is Flats

Does the entire wetland unit meet all of the following criteria? The vegetized part of the welland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 sc. (8 ha) in size; At least 30% of the open water area is deeper than 6.6 ft (2 m)

NO - go to 4

YES - The wetland class is Lake Fringe (Lacustrine Fringe)

Does the rather wetland unit meet all of the following criteria?

The wetland is on a slope (slope can be very gradual).

The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks,

The water leaves the wetland without being impounded.

NO - go to 5

YES - The wotland class is Slope.

shallow depressions or behind hummorks (depressions are usually <3 ft diameter and less than 1 ft NOTE: Surface water dies not pend in these type of wetlands except orgasionally in very small and

- Does the entire wetland unit meet all of the following criteria?
- The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river.
- The overbank flooding occurs at least once every 2 years

Wedland Racing System for Wastern WA: 2014 Opdate Basing Form - Effective January 1, 2015

Wedand name or number

NO - go to 6

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not YES - The wetland class is Riverine

Is the entire wetland unit in a topographic depression in which water punds, or is naturalted to the surface, at some time during the year? This means that any outlet, if present, is higher than the interior of the wetland.

NO - go to 7

YES - The wetland class is Depressional

Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pand surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no ubvious natural Salpho.

NO - go to 8

VES - The wetland class is Depressional

Your wetland unit seems to be difficult to classify and probably contains several different HGM AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small wetland unit being scored. appropriate class to use for the rating system if you have several HGM classes present within the WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY

total arest. is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 NOTE: Use this table only if the class that is recommended in the second column represents 10% or

Saft Water Tidal Fringe and any other class of freshwater wesland	Riverine + Lake Fringe	Depressional + Lake Fringe	Depressional + Riverine along stream within boundary of depression	Slope + Lake Fringe	Singe + Depressional	Slope + Riverine	HGM classes within the wetland unit being rated
Front as	Riverine	Depressional	Depressional	Lake Fringe	Depressional	Riverine	HGM class to

more than 2 HGM classes within a wetland boundary: classify the wetland as Depressional for the If you are still unable to determine which of the above criteria apply to your wetland, or If you have

Parting Form - Effective January 1, 2015 Wedland Rating System for Western WA: 2014 Update

WDFW Priority Habitats

Principly habitats listed by WDFM (see complete descriptions of WDFM priority habitats, and the count—to which they can be found, in: Washington Department of Fish and WBclife. 2008. Priority Libbitst and Species Hat. Olympia, Washington. 177 pp. http://butba.wa.ntv/nubilasusis/00163/wathed0168.pdf or access the list from hore: (Trang squipting family family squipting)

independent of the fand use between the wetland and and the priority hobitate Count laws many of the following paracity habitats are within 330 ft (100 m) of the wetland unit. NOTE: The question is

- Augum Stands: Pure or mixed stands of aspen greater than I ac (0.4 ha).
- Blodiversity Areas and Corridors: Areas of babliar they are relatively important to various species of ratios fish and wildlife (full descripcions in WEVFW PRS report).
- tierbaceous Balds: Variable sine parches of grass and forbs on shallow soils over befrock
- Did-growth /Mature forests: Obl-growth west of Cascadington Stands of at least 2 tree species, forming a multi-layered earnpy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests Stands with average diameters exceeding 21 in (33 cm) dbh or twen over tray to least than 100% decay, decadence, numbers of anals, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- Oregon White Oak: Woodland stands of pure oak or oal/confier associations where campy coverage of the oak component is important (fall descriptions in WDFW PRS report p. 158 we web link above).

Bigarian: The area adjacent to aquatic systems with flowing water that contains elements of teah wastic and terrestrial ecosystems which numbers costs other.

Weatside Praintes: Herbaccous, non-forested plant communities that can either take the form of a dry prainte or a wet prainte (full descriptions in WDFW PMS report µ. 161 - see with flast above).

instream) Lastream) The continuous of physical, biological, and chemical processes and similations that interact to provide Engelogy life history requirements for incream its and wildlife resources.

- Mearthore: Relatively undisturbed hearshore habitats. These include Constal Nearthore, Open Coast Nearthore, and Pages Sound Neurohore. (And descriptions of habitats and the defination of relatively undisturbed are in WDFW report see web Juk on previous page).
- Caves: A naturally occurring envity, rucess, void, or system of interconnected passages under the earth in solis, rock, for other geological formations and is large mough to contain a burnan.
- CHIEs: Greater than 25 ft (7.6 m) high and occurring below 5000 ft eleverion.
- Taken Homogenous areas of nock multible ranging in average size 0.5 6.5 ft (0.15 2.0 m), composed of borait, undesize, and/or exclimentary rock, including ripray slides and mine tailings. May be associated with cliffs.

 Shage and Logs? Trees are considered stage if they are deed or dying and exhibit sufficient decay characteristics to

 Associate of Control of the (6 m) loag.

Note: All vagazitat webands are by definition a priority builder hat are not included in titls let because they are addressed showhere.

RATING ANSWERS FOR WETLAND A

- S1.3 Dense, uncut, woody plants > 1/2 of the area of the unit.
- S4.1 Dense, uncut, rigid plants cover < 90% of the area of the wetland.
- S2.1 & S5.1 Greater than 10 percent of the area within 150' of the uphill side of Wetland A is in land use that generates pollutants and excess runoff (~44%).
- H1.1 & H1.4 The wetland contained scrub-shrub vegetation with low interspersion (prior to recent clearing this wetland was dominated by Laurel and blackberry).
- H1.2 The wetland contains saturated only and seasonally flowing stream hydroperiods.
